Space Weather Forecast

Issued on Thursday, 06 January 2022 at 12:41 Local

This forecast provides a four day assessment of space weather events. The probabilities stated below are for reaching or exceeding the given levels. For more information about space weather impacts please see the Met Office Space Weather Scales https://www.metoffice.gov.uk/weather/learn-about/space-weather/uk-scales

---

Space Weather Forecast Headline: Chance of minor geomagnetic activity day 3 (8th).

Analysis of Space Weather Activity over past 24 hours

Solar Activity: Solar activity was Very Low over the past 24 hours, with only minor flares observed. There are two sunspot regions on the visible disc. These are both currently small and relatively simple regions, located in the bottom-left quadrant of the disc. No Earth-directed Coronal Mass Ejections (CMEs) have been observed in the available imagery.

Solar Wind / Geomagnetic Activity: Solar winds were slightly elevated at the start of the period, before declining to the current background levels. The strength of the magnetic field carried by the wind remained weak, with no notable southward deflections in the north-south direction. Geomagnetic activity was Quiet.

Energetic Particles / Solar Radiation: The count of energetic particles (high energy protons) remained at background with no solar radiation storms observed.

Four-Day Space Weather Forecast Summary

Solar Activity: Mostly Very Low solar activity is expected, with a chance of increasing to Low at times (C-class flaring) from either of the sunspots on the disc. New or returning previous regions will potentially rotate onto the visible disc through the period, with a new region or plage area expected to imminently arrive onto the northeast limb. Therefore solar activity may increase, bringing a slightly raised chance of isolated Moderate-class flares.

Solar Wind / Geomagnetic Activity: There are currently no Earth-directed CMEs. Solar winds are expected to remain mainly slow and ambient until day 3 (8th), when winds are likely to pick up again in response to a fast wind from a coronal hole. Mainly Quiet geomagnetic conditions are expected until then, increasing to Unsettled to Active from day 3 (8th Jan) with a chance of Minor storm intervals.

Energetic Particles / Solar Radiation: The count of energetic particles (high energy protons) is forecast to persist at background with no solar radiation storms anticipated in the absence of solar activity.

Space Weather Forecast

Geomagnetic Storms:

Geo-Magnetic Storm Probability (Exceedance)	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Minor or Moderate	G1 to G2	No	1	5	20	20
Strong	G3	No	1	1	1	1
Severe	G4	No	1	1	1	1
Extreme	G5	No	1	1	1	1

Radio Blackouts - X Ray Flares:

X Ray Flares Probability	Level	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	R1-R2 M Class	No	5	5	5	10
Very Active	R3 to R5 X	No	1	1	1	1

Solar Radiation Storms - (High Energy Protons):

Radiation Storms Probability (Exceedance)	Level (cm^{-2} sr^{-1} s^{-1})	Past 24 Hours (Yes/No)	Day 1 (00-24 UTC) (%)	Day 2 (00-24 UTC) (%)	Day 3 (00-24 UTC) (%)	Day 4 (00-24 UTC) (%)
Active	≥ S1	No	1	1	1	1
Very Active	≥ S3 *	No	1	1	1	1

* S3 ≥ 10 MeV ≥ 1000 pfu and / or ≥ 50 MeV ≥ 10 pfu. (pfu = $cm^{-2}sr^{-1}s^{-1}$)
